1 Hadoop Foreign Data Wrapper

The Hadoop Foreign Data Wrapper (`hdfs_fdw`) is a Postgres extension that allows you to access data that resides on a Hadoop file system from EDB Postgres Advanced Server. The foreign data wrapper makes the Hadoop file system a read-only data source that you can use with Postgres functions and utilities or with other data that resides on a Postgres host.

2 Release Notes

The Hadoop Foreign Data Wrapper documentation describes the latest version including minor releases and patches. The release notes in this section provide information on what was new in each release. For new functionality introduced in a minor or patch release, there are also indicators within the content about what release introduced the feature.

Version	Release Date
2.3.3	13 Oct 2025
2.3.2	18 Jul 2024
2.3.1	20 Jul 2023
2.3.0	06 Jan 2023
2.2.0	26 May 2022
2.1.0	02 Dec 2021
2.0.8	24 Jun 2021
2.0.7	23 Nov 2020
2.0.5	10 Dec 2019
2.0.4	28 Nov 2018

2.1 Hadoop Foreign Data Wrapper 2.3.3 release notes

Deprecation

Removed support for version 12 of EDB Postgres Advanced Server, EDB Postgres Extended Server and PostgreSQL.

Released: 13 Oct 2025

Enhancements, bug fixes, and other changes in Hadoop Foreign Data Wrapper 2.3.3 include:

Type	Description
Enhancement	Added support for PostgreSQL, EDB Postgres Advanced Server [1] , and EDB Postgres Extended Server [18] .
Enhancement	Added the ability to build the <code>hdfs_fdw</code> extension directly from PostgreSQL's <code>contrib</code> directory.
Enhancement	Added SSL-related foreign server options (<code>ssl</code> , <code>useSystemTrustStore</code> , <code>sslTrustStore</code> , and <code>trustStorePassword</code>) to enable and manage secure connections to the remote Hadoop server.
Bug Fix	Addressed compiler warnings generated by newer GCC versions. These corrections address underlying code issues that could lead to undefined behavior, such as improper memory management or the use of uninitialized variables.

[*] Support for EDB Postgres Advanced Server and EDB Postgres Extended Server 18 was added on 25 Nov 2025.

2.2 Hadoop Foreign Data Wrapper 2.3.2 release notes

Released: 18 Jul 2024

Enhancements, bug fixes, and other changes in Hadoop Foreign Data Wrapper 2.3.2 include:

Type	Description
Enhancement	Added support for PostgreSQL 17 and upcoming EDB Postgres Advanced Server 17.
Feature	Added <code>enable_limit_pushdown</code> GUC to control LIMIT/OFFSET pushdown at the session level.
Deprecation	Removed support for EDB Postgres Advanced Server 11 and PostgreSQL 11.

2.3 Hadoop Foreign Data Wrapper 2.3.1 release notes

Released: 20 Jul 2023

Enhancements, bug fixes, and other changes in Hadoop Foreign Data Wrapper 2.3.1 include:

Type	Description
Enhancement	Added support for PostgreSQL 16.
Feature	Added <code>enable_join_pushdown</code> and <code>enable_aggregate_pushdown</code> GUCs to support JOIN and AGGREGATE pushdowns, respectively.
Feature	Added table and server level option to <code>enable_order_by_pushdown</code> and <code>enable_aggregate_pushdown</code> GUCs.

2.4 Hadoop Foreign Data Wrapper 2.3.0 release notes

Released: 06 Jan 2023

Enhancements, bug fixes, and other changes in Hadoop Foreign Data Wrapper 2.3 include:

Type	Description
Feature	When possible, we push the <code>ORDER BY</code> clause to the remote server. This approach provides the ordered result set from the foreign server, which can help to enable an efficient merge join.
Feature	Push down <code>LIMIT / OFFSET</code> to remote HDFS servers: Where possible, perform <code>LIMIT</code> and <code>OFFSET</code> operations on the remote server. This reduces network traffic between local Postgres and remote HDFS/Hive servers.

2.5 Hadoop Foreign Data Wrapper 2.2.0 release notes

Released: 26 May 2022

Enhancements, bug fixes, and other changes in Hadoop Foreign Data Wrapper 2.2 include:

Type	Description
Feature	Push down aggregates to remote HDFS servers: Push aggregates to the remote HDFS server instead of fetching all of the rows and aggregating them locally. This gives a performance boost for cases where aggregates can be pushed down.
Enhancement	Add support for NUMERIC data type.
Bug fix	Do not push expressions evaluating as non-builtin data types.

2.6 Hadoop Foreign Data Wrapper 2.1.0 release notes

Released: 02 Dec 2021

Enhancements, bug fixes, and other changes in Hadoop Foreign Data Wrapper 2.1.0 include:

Type	Description
Enhancement	Support for EDB Postgres Advanced Server 14.
Enhancement	Join Pushdown: If a query has a join between two foreign tables from the same remote server, you can now push that join down to the remote server instead of fetching all the rows for both the tables and performing a join locally.

2.7 Hadoop Foreign Data Wrapper 2.0.8 release notes

Released: 24 Jun 2021

New features, enhancements, bug fixes, and other changes in Hadoop Foreign Data Wrapper 2.0.8 include the following:

Type	Description
Enhancement	Support for Hadoop version 3.2.x
Enhancement	Support for Hive version 3.1.x
Enhancement	Support for Spark version 3.0.x
Bug Fix	Fixed building a SELECT query having a whole-row reference to avoid an error.
Bug Fix	Fixed crash with the queries involving LEFT JOIN LATERAL.
Bug Fix	Use proper hive-SQL quoting of table or column names containing special characters.

2.8 Hadoop Foreign Data Wrapper 2.0.7 release notes

Released: 23 Nov 2020

New features, enhancements, bug fixes, and other changes in Hadoop Foreign Data Wrapper 2.0.7 include the following:

Type	Description
Enhancement	Support for EDB Postgres Advanced Server 13.
Enhancement	Support for Ubuntu 20.04 LTS platform.
Enhancement	Updated LICENSE file.

2.9 Hadoop Foreign Data Wrapper 2.0.5 release notes

Released: 10 Dec 2019

Enhancements, bug fixes, and other changes in Hadoop Foreign Data Wrapper 2.0.5 include:

Type	Description
Enhancement	Support for EDB Postgres Advanced Server 12.

2.10 Hadoop Foreign Data Wrapper 2.0.4 release notes

Released: 28 Nov 2018

Enhancements, bug fixes, and other changes in Hadoop Foreign Data Wrapper 2.0.4 include:

Type	Description
Enhancement	Support for EDB Postgres Advanced Server 11.

3 Supported platforms

The Hadoop Foreign Data Wrapper is supported on the same Linux platforms as EDB Postgres Advanced Server. To determine the platform support for the Hadoop Foreign Data Wrapper, see the [Platform Compatibility page](#) on the EDB website or [Installing Hadoop Foreign Data Wrapper](#).

Supported database versions

This table lists the latest Hadoop Foreign Data Wrapper versions and their supported corresponding EDB Postgres Advanced Server (EPAS), EDB Postgres Extended Server (PGE) and PostgreSQL (PG) versions.

Hadoop Foreign Data Wrapper	EPAS, PGE and PG 18	EPAS, PGE and PG 17	EPAS, PGE and PG 16	EPAS, PGE and PG 15	EPAS, PGE and PG 14	EPAS, PGE and PG 13
2.3.3	Y	Y	Y	Y	Y	Y
2.3.2	N	Y	Y	Y	Y	Y
2.3.1	N	N	Y	Y	Y	Y
2.3.0	N	N	N	Y	Y	Y
2.2.0	N	N	N	Y	Y	Y
2.1.0	N	N	N	N	Y	Y
2.0.9	N	N	N	N	Y	Y
2.0.8	N	N	N	N	N	Y
2.0.7	N	N	N	N	N	Y
2.0.6	N	N	N	N	N	Y

4 Architecture overview

Hadoop is a framework that allows you to store a large data set in a distributed file system.

The Hadoop data wrapper provides an interface between a Hadoop file system and a Postgres database. The Hadoop data wrapper transforms a Postgres `SELECT` statement into a query that is understood by the HiveQL or Spark SQL interface.

When possible, the foreign data wrapper asks the Hive or Spark server to perform the actions associated with the `WHERE` clause of a `SELECT` statement. Pushing down the `WHERE` clause improves performance by decreasing the amount of data moving across the network.

5 Key features

These are the key features of the Hadoop Foreign Data Wrapper.

WHERE clause pushdown

Hadoop Foreign Data Wrapper allows the pushdown of `WHERE` clauses to the foreign server for execution. This feature optimizes remote queries to reduce the number of rows transferred from foreign servers.

Column pushdown

Hadoop Foreign Data Wrapper supports column pushdown. As a result, the query brings back only those columns that are a part of the select target list.

Join pushdown

Hadoop Foreign Data Wrapper supports join pushdown. It pushes the joins between the foreign tables of the same remote Hive or Spark server to the remote Hive or Spark server, enhancing the performance.

From version 2.3.0 and later, you can enable the join pushdown at session and query level using the `enable_join_pushdown` GUC variable.

For more information, see [Example: Join pushdown](#).

Aggregate pushdown

Hadoop Foreign Data Wrapper supports aggregate pushdown. It pushes the aggregates to the remote Hive or Spark server instead of fetching all of the rows and aggregating them locally. This gives a very good performance boost for the cases where aggregates can be pushed down. The pushdown is currently limited to aggregate functions min, max, sum, avg, and count, to avoid pushing down the functions that are not present on the Hadoop server. Also, aggregate filters and orders are not pushed down.

For more information, see [Example: Aggregate pushdown](#).

ORDER BY pushdown

Hadoop Foreign Data Wrapper supports order by pushdown. If possible, push the `ORDER BY` clause to the remote server. This approach provides the ordered result set from the foreign server, which can help to enable an efficient merge join.

For more information, see [Example: ORDER BY pushdown](#)

LIMIT OFFSET pushdown

Hadoop Foreign Data Wrapper supports limit offset pushdown. Wherever possible, perform LIMIT and OFFSET operations on the remote server. This reduces network traffic between local Postgres and remote HDFS/Hive servers. ALL/NULL options aren't supported on the Hive server, which means they are not pushed down. Also, OFFSET without LIMIT isn't supported on the remote server. Queries having that construct are not pushed.

For more information, see [Example: LIMIT OFFSET pushdown](#)

Automated cleanup

Hadoop Foreign Data Wrapper allows the cleanup of foreign tables in a single operation using the `DROP EXTENSION` command. This feature is specifically useful when a foreign table is set for a temporary purpose. The syntax is:

```
DROP EXTENSION hdfs_fdw CASCADE;
```

For more information, see [DROP EXTENSION](#).

6 Supported authentication methods

The Hadoop Foreign Data Wrapper supports NOSASL and LDAP authentication modes. To use NOSASL, don't specify any `OPTIONS` values while creating user mapping. For LDAP authentication mode, specify `username` and `password` in `OPTIONS` while creating user mapping.

Using LDAP authentication

When using the Hadoop Foreign Data Wrapper with `LDAP` authentication, first configure the Hive server or Spark server to use LDAP authentication. The configured server must provide a `hive-site.xml` file that includes the connection details for the LDAP server. For example:

```
<property>
  <name>hive.server2.authentication</name>
  <value>LDAP</value>
  <description>
    Expects one of [nosasl, none, ldap, kerberos, pam, custom].
    Client authentication types.
    NONE: no authentication check
    LDAP: LDAP/AD based authentication
    KERBEROS: Kerberos/GSSAPI authentication
    CUSTOM: Custom authentication provider
           (Use with property hive.server2.custom.authentication.class)
    PAM: Pluggable authentication module
    NOSASL: Raw transport
  </description>
</property>
<property>
  <name>hive.server2.authentication.ldap.url</name>
  <value>ldap://localhost</value>
  <description>LDAP connection URL</description>
</property>
<property>
  <name>hive.server2.authentication.ldap.baseDN</name>
  <value>ou=People,dc=itzgeek,dc=local</value>
  <description>LDAP base DN</description>
</property>
```

Then, when starting the Hive server, include the path to the `hive-site.xml` file in the command. For example:

```
./hive --config <path_to_hive-site.xml_file> --service hiveServer2
```

`<path_to_hive-site.xml_file>` specifies the complete path to the `hive-site.xml` file.

When creating the user mapping, you must provide the name of a registered LDAP user and the corresponding password as options. For details, see [Create user mapping](#).

Using NOSASL authentication

When using NOSASL authentication with the Hadoop Foreign Data Wrapper, set the authorization to `None` and the authentication method to `NOSASL` on the Hive server or Spark server. For example, if you start the Hive server at the command line, include the `hive.server2.authentication` configuration parameter in the command:

```
hive --service hiveserver2 --hiveconf hive.server2.authentication=NOSASL
```

7 Installing Hadoop Foreign Data Wrapper on Linux

Select a link to access the applicable installation instructions:

Linux [x86-64 \(amd64\)](#)

Red Hat Enterprise Linux (RHEL) and derivatives

- [RHEL 9, RHEL 8](#)
- [Oracle Linux \(OL\) 9, Oracle Linux \(OL\) 8](#)

7.1 Installing Hadoop Foreign Data Wrapper on Linux x86 (amd64)

Operating system-specific install instructions are described in the corresponding documentation:

Red Hat Enterprise Linux (RHEL) and derivatives

- [RHEL 9](#)
- [RHEL 8](#)
- [Oracle Linux \(OL\) 9](#)
- [Oracle Linux \(OL\) 8](#)
- [Rocky Linux 9](#)
- [Rocky Linux 8](#)
- [AlmaLinux 9](#)
- [AlmaLinux 8](#)

SUSE Linux Enterprise (SLES)

- [SLES 15](#)

Debian and derivatives

- [Ubuntu 24.04](#)
- [Ubuntu 22.04](#)
- [Debian 12](#)
- [Debian 11](#)

After you complete the installation, see [Initial configuration](#).

7.1.1 Installing Hadoop Foreign Data Wrapper on RHEL 9 or OL 9 x86_64

Prerequisites

Before you begin the installation process:

- Install Postgres on the same host. See:
 - [Installing EDB Postgres Advanced Server](#)
 - [Installing PostgreSQL](#)
- Set up the EDB repository.

Setting up the repository is a one-time task. If you already set up your repository, you don't need to perform this step.

To determine if your repository exists, enter:

```
dnf repolist | grep enterprisedb
```

If no output is generated, the repository is installed.

To set up the EDB repository:

1. Go to [EDB repositories](#).
2. Select the button that provides access to the EDB repository.
3. Select the platform and software that you want to download.
4. Follow the instructions for setting up the EDB repository.

- Install the EPEL repository:

```
sudo dnf -y install https://dl.fedoraproject.org/pub/epel/epel-release-latest-9.noarch.rpm
```

- Enable additional repositories to resolve dependencies:

```
sudo dnf config-manager --set-enabled PowerTools
```

Install the package

```
# For EDB Postgres Advanced Server:
sudo dnf -y install edb-as<X>-hdfs_fdw

# For EDB Postgres Extended Server:
sudo dnf -y install edb-postgresextended<X>-hdfs_fdw

# For PostgreSQL:
sudo dnf -y install postgresql-<X>-hdfs_fdw
```

Where `<X>` is the version of your Postgres.

7.1.2 Installing Hadoop Foreign Data Wrapper on RHEL 8 or OL 8 x86_64

Prerequisites

Before you begin the installation process:

- Install Postgres on the same host. See:
 - [Installing EDB Postgres Advanced Server](#)
 - [Installing PostgreSQL](#)
- Set up the EDB repository.

Setting up the repository is a one-time task. If you already set up your repository, you don't need to perform this step.

To determine if your repository exists, enter:

```
dnf repolist | grep enterprisedb
```

If no output is generated, the repository is installed.

To set up the EDB repository:

1. Go to [EDB repositories](#).
2. Select the button that provides access to the EDB repository.
3. Select the platform and software that you want to download.
4. Follow the instructions for setting up the EDB repository.

- Install the EPEL repository:

```
sudo dnf -y install https://dl.fedoraproject.org/pub/epel/epel-release-latest-8.noarch.rpm
```

- Enable additional repositories to resolve dependencies:

```
sudo dnf config-manager --set-enabled PowerTools
```

Install the package

```
# For EDB Postgres Advanced Server:
sudo dnf -y install edb-as<X>-hdfs_fdw

# For EDB Postgres Extended Server:
sudo dnf -y install edb-postgresextended<X>-hdfs_fdw

# For PostgreSQL:
sudo dnf -y install postgresql-<X>-hdfs_fdw
```

Where `<X>` is the version of your Postgres.

7.1.3 Installing Hadoop Foreign Data Wrapper on AlmaLinux 9 or Rocky Linux 9 x86_64

Prerequisites

Before you begin the installation process:

- Install Postgres on the same host. See:
 - [Installing EDB Postgres Advanced Server](#)
 - [Installing PostgreSQL](#)
- Set up the EDB repository.

Setting up the repository is a one-time task. If you already set up your repository, you don't need to perform this step.

To determine if your repository exists, enter:

```
dnf repolist | grep enterprisedb
```

If no output is generated, the repository is installed.

To set up the EDB repository:

1. Go to [EDB repositories](#).
2. Select the button that provides access to the EDB repository.
3. Select the platform and software that you want to download.
4. Follow the instructions for setting up the EDB repository.

- Install the EPEL repository:

```
sudo dnf -y install epel-release
```

- Enable additional repositories to resolve dependencies:

```
sudo dnf config-manager --set-enabled crb
```

Install the package

```
# For EDB Postgres Advanced Server:
sudo dnf -y install edb-as<X>-hdfs_fdw

# For EDB Postgres Extended Server:
sudo dnf -y install edb-postgresextended<X>-hdfs_fdw

# For PostgreSQL:
sudo dnf -y install postgresql-<X>-hdfs_fdw
```

Where `<X>` is the version of your Postgres.

7.1.4 Installing Hadoop Foreign Data Wrapper on AlmaLinux 8 or Rocky Linux 8 x86_64

Prerequisites

Before you begin the installation process:

- Install Postgres on the same host. See:
 - [Installing EDB Postgres Advanced Server](#)
 - [Installing PostgreSQL](#)
- Set up the EDB repository.

Setting up the repository is a one-time task. If you already set up your repository, you don't need to perform this step.

To determine if your repository exists, enter:

```
dnf repolist | grep enterprisedb
```

If no output is generated, the repository is installed.

To set up the EDB repository:

1. Go to [EDB repositories](#).
2. Select the button that provides access to the EDB repository.
3. Select the platform and software that you want to download.
4. Follow the instructions for setting up the EDB repository.

- Install the EPEL repository:

```
sudo dnf -y install epel-release
```

- Enable additional repositories to resolve dependencies:

```
sudo dnf config-manager --set-enabled powertools
```

Install the package

```
# For EDB Postgres Advanced Server:
sudo dnf -y install edb-as<X>-hdfs_fdw

# For EDB Postgres Extended Server:
sudo dnf -y install edb-postgresextended<X>-hdfs_fdw

# For PostgreSQL:
sudo dnf -y install postgresql-<X>-hdfs_fdw
```

Where `<X>` is the version of your Postgres.

7.1.5 Installing Hadoop Foreign Data Wrapper on SLES 15 x86_64

Prerequisites

Before you begin the installation process:

- Install Postgres on the same host. See:
 - [Installing EDB Postgres Advanced Server](#)
 - [Installing PostgreSQL](#)
- Set up the EDB repository.

Setting up the repository is a one-time task. If you already set up your repository, you don't need to perform this step.

To determine if your repository exists, enter:

```
zypper lr -E | grep enterprisedb
```

If no output is generated, the repository is installed.

To set up the EDB repository:

1. Go to [EDB repositories](#).
2. Select the button that provides access to the EDB repository.
3. Select the platform and software that you want to download.
4. Follow the instructions for setting up the EDB repository.

- Activate the required SUSE module:

```
sudo SUSEConnect -p PackageHub/15.7/x86_64
```

- Refresh the metadata:

```
sudo zypper refresh
```

Install the package

```
# For EDB Postgres Advanced Server:
sudo zypper -n install edb-as<X>-hdfs_fdw

# For EDB Postgres Extended Server:
sudo zypper -n install edb-postgresextended<X>-hdfs-fdw

# For PostgreSQL:
sudo zypper -n install postgresql-<X>-hdfs-fdw
```

Where `<X>` is the version of your Postgres.

7.1.6 Installing Hadoop Foreign Data Wrapper on Ubuntu 24.04 x86_64

Prerequisites

Before you begin the installation process:

- Install Postgres on the same host. See:
 - [Installing EDB Postgres Advanced Server](#)
 - [Installing PostgreSQL](#)
- Set up the EDB repository.

Setting up the repository is a one-time task. If you already set up your repository, you don't need to perform this step.

To determine if your repository exists, enter:

```
apt-cache search enterprisedb
```

If no output is generated, the repository is installed.

To set up the EDB repository:

1. Go to [EDB repositories](#).
2. Select the button that provides access to the EDB repository.
3. Select the platform and software that you want to download.
4. Follow the instructions for setting up the EDB repository.

Install the package

```
# For EDB Postgres Advanced Server:
sudo apt-get -y install edb-as<X>-hdfs_fdw

# For EDB Postgres Extended Server:
sudo apt-get -y install edb-postgresextended<X>-hdfs_fdw

# For PostgreSQL:
sudo apt-get -y install postgresql-<X>-hdfs_fdw
```

Where `<X>` is the version of your Postgres.

7.1.7 Installing Hadoop Foreign Data Wrapper on Ubuntu 22.04 x86_64

Prerequisites

Before you begin the installation process:

- Install Postgres on the same host. See:
 - [Installing EDB Postgres Advanced Server](#)
 - [Installing PostgreSQL](#)
- Set up the EDB repository.

Setting up the repository is a one-time task. If you already set up your repository, you don't need to perform this step.

To determine if your repository exists, enter:

```
apt-cache search enterprisedb
```

If no output is generated, the repository is installed.

To set up the EDB repository:

1. Go to [EDB repositories](#).
2. Select the button that provides access to the EDB repository.
3. Select the platform and software that you want to download.
4. Follow the instructions for setting up the EDB repository.

Install the package

```
# For EDB Postgres Advanced Server:
sudo apt-get -y install edb-as<X>-hdfs_fdw

# For EDB Postgres Extended Server:
sudo apt-get -y install edb-postgresextended<X>-hdfs-fdw

# For PostgreSQL:
sudo apt-get -y install postgresql-<X>-hdfs-fdw
```

Where `<X>` is the version of your Postgres.

7.1.8 Installing Hadoop Foreign Data Wrapper on Debian 12 x86_64

Prerequisites

Before you begin the installation process:

- Install Postgres on the same host. See:
 - [Installing EDB Postgres Advanced Server](#)
 - [Installing PostgreSQL](#)
- Set up the EDB repository.

Setting up the repository is a one-time task. If you already set up your repository, you don't need to perform this step.

To determine if your repository exists, enter:

```
apt-cache search enterprisedb
```

If no output is generated, the repository is installed.

To set up the EDB repository:

1. Go to [EDB repositories](#).
2. Select the button that provides access to the EDB repository.
3. Select the platform and software that you want to download.
4. Follow the instructions for setting up the EDB repository.

Install the package

```
# For EDB Postgres Advanced Server:
sudo apt-get -y install edb-as<X>-hdfs_fdw

# For EDB Postgres Extended Server:
sudo apt-get -y install edb-postgresextended<X>-hdfs-fdw

# For PostgreSQL:
sudo apt-get -y install postgresql-<X>-hdfs-fdw
```

Where `<X>` is the version of your Postgres.

7.1.9 Installing Hadoop Foreign Data Wrapper on Debian 11 x86_64

Prerequisites

Before you begin the installation process:

- Install Postgres on the same host. See:
 - [Installing EDB Postgres Advanced Server](#)
 - [Installing PostgreSQL](#)
- Set up the EDB repository.

Setting up the repository is a one-time task. If you already set up your repository, you don't need to perform this step.

To determine if your repository exists, enter:

```
apt-cache search enterprisedb
```

If no output is generated, the repository is installed.

To set up the EDB repository:

1. Go to [EDB repositories](#).
2. Select the button that provides access to the EDB repository.
3. Select the platform and software that you want to download.
4. Follow the instructions for setting up the EDB repository.

Install the package

```
# For EDB Postgres Advanced Server:
sudo apt-get -y install edb-as<X>-hdfs_fdw

# For EDB Postgres Extended Server:
sudo apt-get -y install edb-postgresextended<X>-hdfs_fdw

# For PostgreSQL:
sudo apt-get -y install postgresql-<X>-hdfs_fdw
```

Where `<X>` is the version of your Postgres.

7.2 Installing Hadoop Foreign Data Wrapper on Linux AArch64 (ARM64)

Operating system-specific install instructions are described in the corresponding documentation:

Red Hat Enterprise Linux (RHEL) and derivatives

- [RHEL 9](#)
- [Oracle Linux \(OL\) 9](#)

Debian and derivatives

- [Debian 12](#)

After you complete the installation, see [Initial configuration](#).

7.2.1 Installing Hadoop Foreign Data Wrapper on RHEL 9 or OL 9 arm64

Prerequisites

Before you begin the installation process:

- Install Postgres on the same host. See:
 - [Installing EDB Postgres Advanced Server](#)
 - [Installing PostgreSQL](#)
- Set up the EDB repository.

Setting up the repository is a one-time task. If you already set up your repository, you don't need to perform this step.

To determine if your repository exists, enter:

```
dnf repolist | grep enterprisedb
```

If no output is generated, the repository is installed.

To set up the EDB repository:

1. Go to [EDB repositories](#).
2. Select the button that provides access to the EDB repository.
3. Select the platform and software that you want to download.
4. Follow the instructions for setting up the EDB repository.

- Install the EPEL repository:

```
sudo dnf -y install https://dl.fedoraproject.org/pub/epel/epel-release-latest-9.noarch.rpm
```

- Enable additional repositories to resolve dependencies:

```
sudo dnf config-manager --set-enabled PowerTools
```

Install the package

```
# For EDB Postgres Advanced Server:
sudo dnf -y install edb-as<X>-hdfs_fdw

# For EDB Postgres Extended Server:
sudo dnf -y install edb-postgresextended<X>-hdfs-fdw

# For PostgreSQL:
sudo dnf -y install postgresql-<X>-hdfs-fdw
```

Where `<X>` is the version of your Postgres.

7.2.2 Installing Hadoop Foreign Data Wrapper on Debian 12 arm64

Prerequisites

Before you begin the installation process:

- Install Postgres on the same host. See:
 - [Installing EDB Postgres Advanced Server](#)
 - [Installing PostgreSQL](#)
- Set up the EDB repository.

Setting up the repository is a one-time task. If you already set up your repository, you don't need to perform this step.

To determine if your repository exists, enter:

```
apt-cache search enterprisedb
```

If no output is generated, the repository is installed.

To set up the EDB repository:

1. Go to [EDB repositories](#).
2. Select the button that provides access to the EDB repository.
3. Select the platform and software that you want to download.
4. Follow the instructions for setting up the EDB repository.

Install the package

```
# For EDB Postgres Advanced Server:
sudo apt-get -y install edb-as<X>-hdfs_fdw

# For EDB Postgres Extended Server:
sudo apt-get -y install edb-postgresextended<X>-hdfs-fdw

# For PostgreSQL:
sudo apt-get -y install postgresql-<X>-hdfs-fdw
```

Where `<X>` is the version of your Postgres.

7.3 Installing Hadoop Foreign Data Wrapper on Linux IBM Power (ppc64le)

Operating system-specific install instructions are described in the corresponding documentation:

Red Hat Enterprise Linux (RHEL)

- [RHEL 9](#)
- [RHEL 8](#)

SUSE Linux Enterprise (SLES)

- [SLES 15](#)

After you complete the installation, see [Initial configuration](#).

7.3.1 Installing Hadoop Foreign Data Wrapper on RHEL 9 ppc64le

Prerequisites

Before you begin the installation process:

- Install Postgres on the same host. See:
 - [Installing EDB Postgres Advanced Server](#)
 - [Installing PostgreSQL](#)
- Set up the EDB repository.

Setting up the repository is a one-time task. If you already set up your repository, you don't need to perform this step.

To determine if your repository exists, enter:

```
dnf repolist | grep enterprisedb
```

If no output is generated, the repository is installed.

To set up the EDB repository:

1. Go to [EDB repositories](#).
2. Select the button that provides access to the EDB repository.
3. Select the platform and software that you want to download.
4. Follow the instructions for setting up the EDB repository.

- Install the EPEL repository:

```
sudo dnf -y install https://dl.fedoraproject.org/pub/epel/epel-release-latest-9.noarch.rpm
```

- Refresh the cache:

```
sudo dnf makecache
```

Install the package

```
# For EDB Postgres Advanced Server:
sudo dnf -y install edb-as<X>-hdfs_fdw

# For EDB Postgres Extended Server:
sudo dnf -y install edb-postgresextended<X>-hdfs-fdw

# For PostgreSQL:
sudo dnf -y install postgresql-<X>-hdfs-fdw
```

Where `<X>` is the version of your Postgres.

7.3.2 Installing Hadoop Foreign Data Wrapper on RHEL 8 ppc64le

Prerequisites

Before you begin the installation process:

- Install Postgres on the same host. See:
 - [Installing EDB Postgres Advanced Server](#)
 - [Installing PostgreSQL](#)
- Set up the EDB repository.

Setting up the repository is a one-time task. If you already set up your repository, you don't need to perform this step.

To determine if your repository exists, enter:

```
dnf repolist | grep enterprisedb
```

If no output is generated, the repository is installed.

To set up the EDB repository:

1. Go to [EDB repositories](#).
2. Select the button that provides access to the EDB repository.
3. Select the platform and software that you want to download.
4. Follow the instructions for setting up the EDB repository.

- Install the EPEL repository:

```
sudo dnf -y install https://dl.fedoraproject.org/pub/epel/epel-release-latest-8.noarch.rpm
```

- Refresh the cache:

```
sudo dnf makecache
```

Install the package

```
# For EDB Postgres Advanced Server:
sudo dnf -y install edb-as<X>-hdfs_fdw

# For EDB Postgres Extended Server:
sudo dnf -y install edb-postgresextended<X>-hdfs-fdw

# For PostgreSQL:
sudo dnf -y install postgresql-<X>-hdfs-fdw
```

Where `<X>` is the version of your Postgres.

7.3.3 Installing Hadoop Foreign Data Wrapper on SLES 15 ppc64le

Prerequisites

Before you begin the installation process:

- Install Postgres on the same host. See:
 - [Installing EDB Postgres Advanced Server](#)
 - [Installing PostgreSQL](#)
- Set up the EDB repository.

Setting up the repository is a one-time task. If you already set up your repository, you don't need to perform this step.

To determine if your repository exists, enter:

```
zypper lr -E | grep enterprisedb
```

If no output is generated, the repository is installed.

To set up the EDB repository:

1. Go to [EDB repositories](#).
2. Select the button that provides access to the EDB repository.
3. Select the platform and software that you want to download.
4. Follow the instructions for setting up the EDB repository.

- Activate the required SUSE module:

```
sudo SUSEConnect -p PackageHub/15.7/ppc64le
```

- Refresh the metadata:

```
sudo zypper refresh
```

Install the package

```
# For EDB Postgres Advanced Server:
sudo zypper -n install edb-as<X>-hdfs_fdw

# For EDB Postgres Extended Server:
sudo zypper -n install edb-postgresextended<X>-hdfs-fdw

# For PostgreSQL:
sudo zypper -n install postgresql-<X>-hdfs-fdw
```

Where `<X>` is the version of your Postgres.

8 Initial configuration

Before creating the extension and the database objects that use the extension, you must modify the Postgres host, providing the location of the supporting libraries.

After installing Postgres, modify `postgresql.conf`, located in:

```
/var/lib/edb/as_version/data
```

Modify the configuration file, adding the `hdfs_fdw.jvm_path` parameter to the end of the configuration file and setting the value to specify the location of the Java virtual machine (`libjvm.so`). Set the value of `hdfs_fdw.classpath` to indicate the location of the Java class files used by the adapter. Use a colon (:) as a delimiter between each path. For example:

```
hdfs_fdw.classpath=
'/usr/edb/as12/lib/HiveJdbcClient-1.0.jar:/home/edb/Projects/hadoop_fdw/hadoop/share/hadoop/common/hadoop-common-
2.6.4.jar:/home/edb/Projects/hadoop_fdw/apache-hive-1.0.1-bin/lib/hive-jdbc-1.0.1-standalone.jar'
hdfs_fdw.jvm_path='/usr/lib/jvm/java-1.17.0-openjdk-amd64/lib/server/'
```

Note

Copy the jar files (`hive-jdbc-1.0.1-standalone.jar` and `hadoop-common-2.6.4.jar`) from the respective Hive and Hadoop sources or website to the PostgreSQL instance where Hadoop Foreign Data Wrapper is installed.

If you're using EDB Postgres Advanced Server and have a `DATE` column in your database, you must set `edb_redwood_date = OFF` in the `postgresql.conf` file.

After setting the parameter values, restart the Postgres server. For detailed information about controlling the service on an EDB Postgres Advanced Server host, see the [EDB Postgres Advanced Server documentation](#).

Before using the Hadoop Foreign Data Wrapper:

1. Use the [CREATE EXTENSION](#) command to create the extension on the Postgres host.
2. Use the [CREATE SERVER](#) command to define a connection to the Hadoop file system.
3. Use the [CREATE USER MAPPING](#) command to define a mapping that associates a Postgres role with the server.
4. Use the [CREATE FOREIGN TABLE](#) command to define a table in the EDB Postgres Advanced Server database that corresponds to a database that resides on the Hadoop cluster.

CREATE EXTENSION

Use the [CREATE EXTENSION](#) command to create the `hdfs_fdw` extension. To invoke the command, use your client of choice (for example, `psql`) to connect to the Postgres database from which you will be querying the Hive or Spark server, and invoke the command:

```
CREATE EXTENSION [IF NOT EXISTS] hdfs_fdw [WITH] [SCHEMA
schema_name];
```

Parameters

`IF NOT EXISTS`

Include the `IF NOT EXISTS` clause to instruct the server to issue a notice instead of returning an error if an extension with the same name already exists.

`schema_name`

Optionally specify the name of the schema in which to install the extension's objects.

Example

The following command installs the `hdfs_fdw` Hadoop Foreign Data Wrapper:

```
CREATE EXTENSION hdfs_fdw;
```

For more information about using the foreign data wrapper `CREATE EXTENSION` command, see the [PostgreSQL documentation](#).

CREATE SERVER

Use the [CREATE SERVER](#) command to define a connection to a foreign server. The syntax is:

```
CREATE SERVER server_name FOREIGN DATA WRAPPER
hdfs_fdw
[OPTIONS (option 'value' [,
...])]
```

The role that defines the server is the owner of the server. Use the [ALTER SERVER](#) command to reassign ownership of a foreign server. To create a foreign server, you must have `USAGE` privilege on the foreign-data wrapper specified in the [CREATE SERVER](#) command.

Parameters

`server_name`

Use `server_name` to specify a name for the foreign server. The server name must be unique in the database.

`FOREIGN_DATA_WRAPPER`

Include the `FOREIGN_DATA_WRAPPER` clause to specify for the server to use the `hdfs_fdw` foreign data wrapper when connecting to the cluster.

OPTIONS

Use the `OPTIONS` clause of the `CREATE SERVER` command to specify connection information for the foreign server. You can include:

Option	Description
<code>host</code>	The address or hostname of the Hadoop cluster. The default value is <code>localhost</code> .
<code>port</code>	The port number of the Hive Thrift Server or Spark Thrift Server. The default is <code>10000</code> .
<code>client_type</code>	Specify <code>hiveserver2</code> or <code>spark</code> as the client type. To use the <code>ANALYZE</code> statement on Spark, you must specify a value of <code>spark</code> . The default value is <code>hiveserver2</code> .
<code>auth_type</code>	The authentication type of the client. Specify <code>LDAP</code> or <code>NOSASL</code> . If you don't specify an <code>auth_type</code> , the data wrapper determines the value based on the user mapping: <code>LDAP</code> is used if the user mapping includes a user name and password, otherwise <code>NOSASL</code> is used. Important: If the server's authentication mode is <code>NOSASL</code> , the JDBC connection string only accepts the case-sensitive value <code>noSasl</code> . Therefore, you must specify <code>auth_type</code> as <code>'noSasl'</code> to ensure a valid connection.
<code>ssl</code>	Set this boolean option to true when SSL is enabled on the hive server. The default value is <code>false</code> .
<code>useSystemTrustStore</code>	Set this boolean option to true to use the host operating system's trust store. This is useful for environments where the necessary SSL certificates are already installed and trusted at the system level. The default is <code>false</code> .
<code>sslTrustStore</code>	Use this option to specify the path to a custom certificate trust store file. It is useful when you have a specific certificate you need to trust.
<code>trustStorePassword</code>	If you specify a custom trust store file with <code>sslTrustStore</code> , use this option to provide its password. It is a required parameter when a password-protected trust store is used.
<code>connect_timeout</code>	The length of time before a connection attempt times out. The default value is 300 seconds
<code>enable_aggregate_pushdown</code>	Similar to the table-level option but configured at the server level. If <code>true</code> , pushes the aggregate operations to the foreign server instead of fetching rows from the foreign server and performing the operations locally. You can also set this option for an individual table. The table-level value of the option takes precedence over the server-level option value. Default is <code>true</code> .
<code>enable_join_pushdown</code>	Similar to the table-level option but configured at the server level. If <code>true</code> , pushes the join between two foreign tables from the same foreign server instead of fetching all the rows for both the tables and performing a join locally. You can also set this option for an individual table and, if any of the tables involved in the join has set the option to <code>false</code> , then the join isn't pushed down. The table-level value of the option takes precedence over the server-level option value. Default is <code>true</code> .
<code>enable_order_by_pushdown</code>	Similar to the table-level option but configured at the server level. If <code>true</code> , pushes the order-by operation to the foreign server instead of fetching rows from the foreign server and performing the sort locally. You can also set this option for an individual table. The table-level value of the option takes precedence over the server-level option value. Default is <code>true</code> .
<code>fetch_size</code>	Provided as a parameter to the JDBC API <code>setFetchSize</code> . The default value is <code>10,000</code> .
<code>log_remote_sql</code>	If <code>true</code> , logging includes SQL commands executed on the remote Hive server and the number of times that a scan is repeated. The default is <code>false</code> .
<code>query_timeout</code>	Use <code>query_timeout</code> to provide the number of seconds after which a request times out if it isn't satisfied by the Hive server. Query timeout is not supported by the Hive JDBC driver.
<code>use_remote_estimate</code>	Include <code>use_remote_estimate</code> to instruct the server to use <code>EXPLAIN</code> commands on the remote server when estimating processing costs. By default, <code>use_remote_estimate</code> is <code>false</code> , and remote tables are assumed to have 1000 rows.

Example

The following command creates a foreign server named `hdfs_server` that uses the `hdfs_fdw` foreign data wrapper to connect to a host with an IP address of `170.11.2.148`:

```
CREATE SERVER hdfs_server FOREIGN DATA WRAPPER hdfs_fdw OPTIONS (host '170.11.2.148', port '10000', client_type 'hiveserver2', auth_type 'LDAP', ssl 'true', useSystemTrustStore 'true', connect_timeout '10000', query_timeout '10000');
```

The foreign server uses the default port (10000) for the connection to the client on the Hadoop cluster. The connection uses an LDAP server with SSL and validates the server's certificate against the local system's trust store.

For more information about using the `CREATE SERVER` command, see the [PostgreSQL documentation](#).

CREATE USER MAPPING

Use the `CREATE USER MAPPING` command to define a mapping that associates a Postgres role with a foreign server:

```
CREATE USER MAPPING FOR role_name SERVER
server_name
[OPTIONS (option 'value' [,
...]);
```

You must be the owner of the foreign server to create a user mapping for that server.

Note

The Hadoop Foreign Data Wrapper supports NOSASL and LDAP authentication. If you're creating a user mapping for a server that uses LDAP authentication, use the `OPTIONS` clause to provide the connection credentials (the user name and password) for an existing LDAP user. If the server uses NOSASL authentication, omit the `OPTIONS` clause when creating the user mapping.

Parameters`role_name`

Use `role_name` to specify the role to associate with the foreign server.

`server_name`

Use `server_name` to specify the name of the server that defines a connection to the Hadoop cluster.

OPTIONS

Use the `OPTIONS` clause to specify connection information for the foreign server. If you're using LDAP authentication, provide:

`username` – The name of the user on the LDAP server.

`password` – the password associated with the username.

If you don't provide a user name and password, the data wrapper uses NOSASL authentication.

Example

The following command creates a user mapping for a role named `enterprisedb`. The mapping is associated with a server named `hdfs_server`:

```
CREATE USER MAPPING FOR enterprisedb SERVER hdfs_server;
```

If the database host uses LDAP authentication, provide connection credentials when creating the user mapping:

```
CREATE USER MAPPING FOR enterprisedb SERVER hdfs_server OPTIONS (username 'alice', password '1safepwd');
```

The command creates a user mapping for a role named `enterprisedb` that is associated with a server named `hdfs_server`. When connecting to the LDAP server, the Hive or Spark server authenticates as `alice`, and provides a password of `1safepwd`.

For detailed information about the `CREATE USER MAPPING` command, see the [PostgreSQL documentation](#).

CREATE FOREIGN TABLE

A foreign table is a pointer to a table that resides on the Hadoop host. Before creating a foreign table definition on the Postgres server, connect to the Hive or Spark server and create a table. The columns in the table map to columns in a table on the Postgres server. Then, use the `CREATE FOREIGN TABLE` command to define a table on the Postgres server with columns that correspond to the table that resides on the Hadoop host. The syntax is:

```
CREATE FOREIGN TABLE [ IF NOT EXISTS ] table_name (
[
  { column_name data_type [ OPTIONS ( option 'value' [, ... ] ) ] [ COLLATE collation ] [ column_constraint [ ... ] ]
}
| table_constraint
}
[, ...
]
)
[ INHERITS ( parent_table [, ... ] )
]
SERVER server_name [ OPTIONS ( option 'value' [, ... ] )
]
```

`column_constraint` is:

```
[ CONSTRAINT constraint_name
]
{ NOT NULL | NULL | CHECK (expr) [ NO INHERIT ] | DEFAULT default_expr
}
```

`table_constraint` is:

```
[ CONSTRAINT constraint_name ] CHECK (expr) [ NO INHERIT
]
```

Parameters`table_name`

Specify the name of the foreign table. Include a schema name to specify the schema in which the foreign table resides.

`IF NOT EXISTS`

Include the `IF NOT EXISTS` clause to instruct the server not to return an error if a table with the same name already exists. If a table with the same name exists, the server issues a notice.

`column_name`

Specifies the name of a column in the new table. Each column corresponds to a column described on the Hive or Spark server.

`data_type`

Specify the data type of the column. When possible, specify the same data type for each column on the Postgres server and the Hive or Spark server. If a data type with the same name isn't available, the Postgres server attempts to cast the data type to a type compatible with the Hive or Spark server. If the server can't identify a compatible data type, it returns an error.

`COLLATE collation`

Include the `COLLATE` clause to assign a collation to the column. The column data type's default collation is used by default.

`INHERITS (parent_table [, ...])`

Include the `INHERITS` clause to specify a list of tables from which the new foreign table automatically inherits all columns. Parent tables can be plain tables or foreign tables.

`CONSTRAINT constraint_name`

Specify an optional name for a column or table constraint. If not specified, the server generates a constraint name.

`NOT NULL`

Include the `NOT NULL` keywords to indicate that the column isn't allowed to contain null values.

`NULL`

Include the `NULL` keywords to indicate that the column is allowed to contain null values. This is the default.

`CHECK (expr) [NO INHERIT]`

Use the `CHECK` clause to specify an expression that produces a Boolean result that each row in the table must satisfy. A check constraint specified as a column constraint can reference that column's value only, while an expression appearing in a table constraint can reference multiple columns.

A `CHECK` expression can't contain subqueries or refer to variables other than columns of the current row.

Include the `NO INHERIT` keywords to specify that a constraint can't propagate to child tables.

`DEFAULT default_expr`

Include the `DEFAULT` clause to specify a default data value for the column whose column definition it appears in. The data type of the default expression must match the data type of the column.

`SERVER server_name [OPTIONS (option 'value' [, ...])]`

To create a foreign table that allows you to query a table that resides on a Hadoop file system, include the `SERVER` clause and specify the `server_name` value of the foreign server that uses the Hadoop data adapter.

Use the `OPTIONS` clause to specify the following options and their corresponding values:

Option	Value
<code>dbname</code>	The name of the database on the Hive server. The database name is required.
<code>table_name</code>	The name of the table on the Hive server. The default is the name of the foreign table.
<code>enable_aggregate_pushdown</code>	Similar to the server-level option but configured at the table level. If <code>true</code> , pushes the aggregate operations to the foreign server instead of fetching rows from the foreign server and performing the operations locally. You can also set this option for an individual table. The table-level value of the option takes precedence over the server-level option value. Default is <code>true</code> .
<code>enable_join_pushdown</code>	Similar to the server-level option but configured at the table level. If <code>true</code> , pushes the join between two foreign tables from the same foreign server instead of fetching all the rows for both the tables and performing a join locally. You can also set this option for an individual table. If any of the tables involved in the join has set the option to <code>false</code> , then the join isn't pushed down. The table-level value of the option takes precedence over the server-level option value. Default is <code>true</code> .
<code>enable_order_by_pushdown</code>	Similar to the server-level option but configured at the table level. If <code>true</code> , pushes the order-by operation to the foreign server instead of fetching rows from the foreign server and performing the sort locally. You can also set this option for an individual table. The table-level value of the option takes precedence over the server-level option value. Default is <code>true</code> .

Example

To use data that is stored on a distributed file system, you must create a table on the Postgres host that maps the columns of a Hadoop table to the columns of a Postgres table. For example, for a Hadoop table with the following definition:

```
CREATE TABLE weblog
(
client_ip          STRING,
full_request_date STRING,
day               STRING,
month            STRING,
month_num        INT,
year            STRING,
hour            STRING,
minute          STRING,
second          STRING,
timezone        STRING,
http_verb       STRING,
uri            STRING,
http_status_code STRING,
bytes_returned  STRING,
referrer        STRING,
user_agent      STRING)
row format
delimited
fields terminated by '\t';
```

Execute a command on the Postgres server that creates a comparable table on the Postgres server:

```
CREATE FOREIGN TABLE weblog
(
client_ip          TEXT,
full_request_date TEXT,
day               TEXT,
Month            TEXT,
month_num        INTEGER,
year            TEXT,
hour            TEXT,
minute          TEXT,
second          TEXT,
timezone        TEXT,
http_verb       TEXT,
uri            TEXT,
http_status_code TEXT,
bytes_returned  TEXT,
referrer        TEXT,
user_agent      TEXT
)
SERVER
hdfs_server
OPTIONS (dbname 'webdata', table_name 'weblogs');
```

Include the `SERVER` clause to specify the name of the database stored on the Hadoop file system (`webdata`) and the name of the table (`weblogs`) that corresponds to the table on the Postgres server.

For more information about using the `CREATE FOREIGN TABLE` command, see the [PostgreSQL documentation](#).

Data type mappings

When using the foreign data wrapper, you must create a table on the Postgres server that mirrors the table that resides on the Hive server. The Hadoop data wrapper automatically converts the following Hive data types to the target Postgres type:

Hive	Postgres
BIGINT	BIGINT/INT8
BOOLEAN	BOOL/BOOLEAN
BINARY	BYTEA
CHAR	CHAR
DATE	DATE
DOUBLE	FLOAT8
FLOAT	FLOAT/FLOAT4
INT/INTEGER	INT/INTEGER/INT4
SMALLINT	SMALLINT/INT2
STRING	TEXT
TIMESTAMP	TIMESTAMP
TINYINT	INT2
VARCHAR	VARCHAR

DROP EXTENSION

Use the `DROP EXTENSION` command to remove an extension. To invoke the command, use your client of choice (for example, psql) to connect to the Postgres database from which you're dropping the Hadoop server, and run the command:

```
DROP EXTENSION [ IF EXISTS ] name [, ...] [ CASCADE | RESTRICT ];
```

Parameters

`IF EXISTS`

Include the `IF EXISTS` clause to instruct the server to issue a notice instead of returning an error if an extension with the specified name doesn't exist.

`name`

Optionally, specify the name of the installed extension.

`CASCADE`

Automatically drop objects that depend on the extension. It drops all the other dependent objects too.

`RESTRICT`

Don't allow to drop extension if any objects, other than its member objects and extensions listed in the same `DROP` command, depend on it.

Example

The following command removes the extension from the existing database:

```
DROP EXTENSION hdfs_fdw;
```

For more information about using the foreign data wrapper `DROP EXTENSION` command, see the [PostgreSQL documentation](#).

DROP SERVER

Use the `DROP SERVER` command to remove a connection to a foreign server. The syntax is:

```
DROP SERVER [ IF EXISTS ] name [, ...] [ CASCADE | RESTRICT ]
```

The role that drops the server is the owner of the server. Use the `ALTER SERVER` command to reassign ownership of a foreign server. To drop a foreign server, you must have `USAGE` privilege on the foreign-data wrapper specified in the `DROP SERVER` command.

Parameters

`IF EXISTS`

Include the `IF EXISTS` clause to instruct the server to issue a notice instead of returning an error if a server with the specified name doesn't exist.

`name`

Optionally, specify the name of the installed server.

`CASCADE`

Automatically drop objects that depend on the server. It drops all the other dependent objects too.

`RESTRICT`

Don't allow to drop the server if any objects depend on it.

Example

The following command removes a foreign server named `hdfs_server`:

```
DROP SERVER hdfs_server;
```

For more information about using the `DROP SERVER` command, see the [PostgreSQL documentation](#).

DROP USER MAPPING

Use the `DROP USER MAPPING` command to remove a mapping that associates a Postgres role with a foreign server. You must be the owner of the foreign server to remove a user mapping for that server.

```
DROP USER MAPPING [ IF EXISTS ] FOR { user_name | USER | CURRENT_USER | PUBLIC } SERVER
server_name;
```

Parameters

`IF EXISTS`

Include the `IF EXISTS` clause to instruct the server to issue a notice instead of returning an error if the user mapping doesn't exist.

`user_name`

Specify the user name of the mapping.

`server_name`

Specify the name of the server that defines a connection to the Hadoop cluster.

Example

The following command drops a user mapping for a role named `enterprisedb`. The mapping is associated with a server named `hdfs_server`:

```
DROP USER MAPPING FOR enterprisedb SERVER hdfs_server;
```

For detailed information about the `DROP USER MAPPING` command, see the [PostgreSQL documentation](#).

DROP FOREIGN TABLE

A foreign table is a pointer to a table that resides on the Hadoop host. Use the `DROP FOREIGN TABLE` command to remove a foreign table. Only the owner of the foreign table can drop it.

```
DROP FOREIGN TABLE [ IF EXISTS ] name [, ...] [ CASCADE | RESTRICT
]
```

Parameters

`IF EXISTS`

Include the `IF EXISTS` clause to instruct the server to issue a notice instead of returning an error if the foreign table with the specified name doesn't exist.

`name`

Specify the name of the foreign table.

`CASCADE`

Automatically drop objects that depend on the foreign table. It drops all the other dependent objects too.

`RESTRICT`

Don't allow to drop foreign table if any objects depend on it.

Example

```
DROP FOREIGN TABLE warehouse;
```

For more information about using the `DROP FOREIGN TABLE` command, see the [PostgreSQL documentation](#).

9 Upgrading

If you have an existing installation of Hadoop Foreign Data Wrapper that you installed using the EDB repository, you can update your repository configuration file and then upgrade Hadoop to a more recent product version.

To perform the process, open a terminal window and enter the commands that apply to the operating system and package manager used for the installation:

To update your repository configuration file:

```
sudo <package-manager>
```

Where `<package-manager>` is the package manager used with your operating system:

Package manager	Operating system
dnf	RHEL 8/9 and derivatives
zypper	SLES
apt-get	Debian and Ubuntu

To upgrade to the latest product version, enter one of the following commands:

Operating system	Upgrade command
RHEL 8/9 and derivatives	<code>sudo dnf upgrade edb-as<xx>-hdfs_fdw</code>
SLES	<code>sudo zypper upgrade edb-as<xx>-hdfs_fdw</code>
Debian and Ubuntu	<code>sudo apt-get --only-upgrade install edb-as<xx>-hdfs-fdw edb-hdfs</code>

Where

- `<package-manager>` is the package manager used with your operating system.
- `<xx>` is the EDB Postgres Advanced Server version number.

10 Uninstalling

You use the `remove` command to uninstall Hadoop Foreign Data Wrapper packages. To uninstall, open a terminal window, assume superuser privileges, and enter the command that applies to the operating system and package manager used for the installation:

- On RHEL or Rocky Linux or AlmaLinux 8:

```
dnf remove edb-as<xx>-hdfs_fdw
```

- On SLES:

```
zypper remove edb-as<xx>-hdfs_fdw
```

- On Debian or Ubuntu

```
apt-get remove edb-as<xx>-hdfs_fdw
```

11 Using Apache Hive or Apache Spark

You can use the Hadoop Foreign Data Wrapper either through the Apache Hive or the Apache Spark. Both Hive and Spark store metadata in the configured metastore, where databases and tables are created using HiveQL.

Using HDFS FDW with Apache Hive on top of Hadoop

Apache Hive data warehouse software helps with querying and managing large datasets residing in distributed storage. Hive provides a mechanism to project structure onto this data and query the data using a SQL-like language called HiveQL. At the same time, this language allows traditional map/reduce programmers to plug in their custom mappers and reducers when it's inconvenient or inefficient to express this logic in HiveQL.

You can download the two versions of Hive—HiveServer1 and HiveServer2—from the [Apache Hive website](#).

Note

The Hadoop Foreign Data Wrapper supports only HiveServer2.

To use HDFS FDW with Apache Hive on top of Hadoop:

1. Download [weblogs_parse](#) and follow the instructions at the [Wiki Pentaho website](#).
2. Upload the `weblog_parse.txt` file using these commands:

```
hadoop fs -mkdir /weblogs
hadoop fs -mkdir /weblogs/parse
hadoop fs -put weblog_parse.txt /weblogs/parse/part-00000
```

3. Start HiveServer, if not already running, using following command:

```
$HIVE_HOME/bin/hiveserver2
```

or

```
$HIVE_HOME/bin/hive --service hiveserver2
```

4. Connect to HiveServer2 using the hive beeline client. For example:

```
$ beeline
Beeline version 1.0.1 by Apache Hive
beeline> !connect jdbc:hive2://localhost:10000/default;auth=noSasl
```

5. Create a table in Hive. The example creates a table named `weblogs`:

```
CREATE TABLE weblogs
(
  client_ip          STRING,
  full_request_date  STRING,
  day                STRING,
  month              STRING,
  month_num          INT,
  year               STRING,
  hour               STRING,
  minute             STRING,
  second             STRING,
  timezone           STRING,
  http_verb          STRING,
  uri                STRING,
  http_status_code  STRING,
  bytes_returned    STRING,
  referrer           STRING,
  user_agent         STRING)
row format
delimited
fields terminated by '\t';
```

6. Load data into the table.

```
hadoop fs -cp /weblogs/parse/part-00000 /user/hive/warehouse/weblogs/
```

7. Access your data from Postgres. You can now use the `webLog` table. Once you're connected using `psql`, follow these steps:

```

-- set the GUC variables appropriately, e.g.
:
hdfs_fdw.jvmpath='/home/edb/Projects/hadoop_fdw/jdk1.8.0_111/jre/lib/amd64/server/'
hdfs_fdw.classpath='/usr/local/edb/lib/postgresql/HiveJdbcClient-1.0.jar:/home/edb/Projects/hadoop_fdw/hadoop/share/hadoop/common/hadoop-common-2.6.4.jar:/home/edb/Projects/hadoop_fdw/apache-hive-1.0.1-bin/lib/hive-jdbc-1.0.1-standalone.jar'

-- load extension first time after install
CREATE EXTENSION hdfs_fdw;

-- create server
object
CREATE SERVER
hdfs_server
    FOREIGN DATA WRAPPER
hdfs_fdw
    OPTIONS (host '127.0.0.1');

-- create user

Using HDFS FDW with Apache Spark on top of Hadoop

Apache Spark is a general-purpose distributed computing framework that supports a wide variety of use cases. It provides real-time streaming as well as batch processing with speed, ease-of-use, and sophisticated analytics. Spark doesn't provide a storage layer, as it relies on third-party storage providers like Hadoop, HBASE, Cassandra, S3, and so on. Spark integrates seamlessly with Hadoop and can process existing data. Spark SQL is 100% compatible with HiveQL. You can use it to replace Hiveserver2, using Spark Thrift Server.

To use HDFS FDW with Apache Spark on top of Hadoop:

1. Download and install Apache Spark in local mode.
2. In the folder `$(SPARK_HOME)/conf`, create a file `spark-defaults.conf` containing the following line:

```
spark.sql.warehouse.dir hdfs://localhost:9000/user/hive/warehouse
```

By default, Spark uses `derby` for both the meta data and the data itself (called a warehouse in Spark). To have Spark use Hadoop as a warehouse, add this property.

3. Start Spark Thrift Server.

```
./start-thriftserver.sh
```

4. Make sure Spark Thrift Server is running and writing to a log file.

5. Create a local file (`names.txt`) that contains the following entries:

```
$ cat /tmp/names.txt
1,abcd
2,pqrs
3,wxyz
4,a_b_c
5,p_q_r
,
```

6. Connect to Spark Thrift Server2 using the Spark beeline client. For example:

```
$ beeline
Beeline version 1.2.1.spark2 by Apache Hive
beeline> !connect jdbc:hive2://localhost:10000/default;auth=noSasl org.apache.hive.jdbc.HiveDriver
```

7. Prepare the sample data on Spark. Run the following commands in the beeline command line tool:

```
./beeline
Beeline version 1.2.1.spark2 by Apache Hive
beeline> !connect jdbc:hive2://localhost:10000/default;auth=noSasl org.apache.hive.jdbc.HiveDriver
Connecting to jdbc:hive2://localhost:10000/default;auth=noSasl
Enter password for jdbc:hive2://localhost:10000/default;auth=noSasl:
Connected to: Spark SQL (version 2.1.1)
Driver: Hive JDBC (version 1.2.1.spark2)
Transaction isolation: TRANSACTION_REPEATABLE_READ
0: jdbc:hive2://localhost:10000> create database my_test_db;
+-----+
| Result |
+-----+
+-----+
No rows selected (0.379 seconds)
0: jdbc:hive2://localhost:10000> use my_test_db;
+-----+
| Result |
+-----+
+-----+
No rows selected (0.03 seconds)
0: jdbc:hive2://localhost:10000> create table my_names_tab(a int, name string)
row format delimited fields terminated by ' ';
+-----+
| Result |
+-----+
+-----+
No rows selected (0.11 seconds)
0: jdbc:hive2://localhost:10000>
0: jdbc:hive2://localhost:10000> load data local inpath '/tmp/names.txt'
into table my_names_tab;
+-----+
| Result |
+-----+
+-----+
No rows selected (0.33 seconds)
0: jdbc:hive2://localhost:10000> select * from my_names_tab;
+-----+
| a | name |

| 1 | abcd |
| 2 | pqrs |
| 3 | wxyz |
| 4 | a_b_c |
| 5 | p_q_r |
| NULL | NULL |
+-----+
```

The following commands list the corresponding files in Hadoop:

```
$ hadoop fs -ls /user/hive/warehouse/
Found 1 items
drwxrwxrwx - org.apache.hive.jdbc.HiveDriver supergroup 0 2020-06-12 17:03 /user/hive/warehouse/my_test_db.db

$ hadoop fs -ls /user/hive/warehouse/my_test_db.db/
Found 1 items
drwxrwxrwx - org.apache.hive.jdbc.HiveDriver supergroup 0 2020-06-12 17:03 /user/hive/warehouse/my_test_db.db/my_names_tab
```

8. Access your data from Postgres using psql:

```

-- set the GUC variables appropriately, e.g.
:
hdfs_fdw.jvmppath='/home/edb/Projects/hadoop_fdw/jdk1.8.0_111/jre/lib/amd64/server/'
hdfs_fdw.classpath='/usr/local/edb/lib/postgresql/HiveJdbcClient-1.0.jar:/home/edb/Projects/hadoop_fdw/hadoop/share/hadoop/common/hadoop-common-2.6.4.jar:/home/edb/Projects/hadoop_fdw/apache-hive-1.0.1-bin/lib/hive-jdbc-1.0.1-standalone.jar'

-- load extension first time after install
CREATE EXTENSION hdfs_fdw;

-- create server
object
CREATE SERVER
hdfs_server
FOREIGN DATA WRAPPER
hdfs_fdw
OPTIONS (host '127.0.0.1', port '10000', client_type 'spark', auth_type
'NOSASL');

-- create user
mapping
CREATE USER MAPPING FOR
postgres
SERVER hdfs_server OPTIONS (username 'spark_username', password
'spark_password');

-- create foreign
table
CREATE FOREIGN TABLE f_names_tab( a int, name varchar(255)) SERVER
hdfs_svr
OPTIONS (dbname 'testdb', table_name 'my_names_tab');

-- select the data from foreign
server
select * from f_names_tab;
 a |
name
-----+-----
 1 |
abcd
 2 |
pqrs
 3 |
wxyz
 4 |
a_b_c
 5 |
p_q_r
 0 |
|
(6 rows)

-- EXPLAIN output showing WHERE clause being pushed down to remote
server.
EXPLAIN (verbose, costs off) SELECT name FROM f_names_tab WHERE a >
3;

                QUERY PLAN

-----+-----
Foreign Scan on public.f_names_tab
Output: name
Remote SQL: SELECT name FROM my_test_db.my_names_tab WHERE ((a >
'3'))
(3 rows)

```

Note

This example uses the same port while creating the foreign server because Spark Thrift Server is compatible with Hive Thrift Server. Applications using Hiveserver2 work with Spark except for the behavior of the `ANALYZE` command and the connection string in the case of `NOSASL`. We recommend using `ALTER SERVER` and changing the `client_type` option if you replace Hive with Spark.

12 Example: Join pushdown

This example shows join pushdown between the foreign tables of the same remote HIVE/SPARK server to that remote HIVE/SPARK server:

Tables on HIVE/SPARK server:

```
0: jdbc:hive2://localhost:10000> describe
emp;
+-----+-----+-----+
| col_name | data_type | comment |
+-----+-----+-----+
| empno    | int       | NULL    |
| ename    | string    | NULL    |
| job      | string    | NULL    |
| mgr      | int       | NULL    |
| hiredate | date      | NULL    |
| sal      | int       | NULL    |
| comm     | int       | NULL    |
| deptno   | int       | NULL    |
+-----+-----+-----+
8 rows selected (0.747
seconds)
0: jdbc:hive2://localhost:10000> describe
dept;
+-----+-----+-----+
| col_name | data_type | comment |
+-----+-----+-----+
| deptno   | int       | NULL    |
| dname    | string    | NULL    |
| loc      | string    | NULL    |
+-----+-----+-----+
3 rows selected (0.067
seconds)
```

Tables on Postgres server:

```

-- load extension first time after install
CREATE EXTENSION hdfs_fdw;

-- create server
object
CREATE SERVER hdfs_server FOREIGN DATA WRAPPER hdfs_fdw OPTIONS(host 'localhost', port '10000', client_type 'spark', auth_type
'LDAP');

-- create user
mapping
CREATE USER MAPPING FOR public SERVER hdfs_server OPTIONS (username 'user1', password
'pwd123');

-- create foreign
table
CREATE FOREIGN TABLE dept
(
  deptno
  INTEGER,
  dname          VARCHAR(14),
  loc
  VARCHAR(13)
)
SERVER hdfs_server OPTIONS (dbname 'fdw_db', table_name
'dept');

-- create foreign
table
CREATE FOREIGN TABLE emp
(
  empno          INTEGER,
  ename          VARCHAR(10),
  job
  VARCHAR(9),
  mgr
  INTEGER,
  hiredate
  DATE,
  sal
  INTEGER,
  comm           INTEGER,
  deptno
  INTEGER
)
SERVER hdfs_server OPTIONS (dbname 'fdw_db', table_name
'emp');

```

Queries with join pushdown:

```

--inner join
edb=# EXPLAIN VERBOSE SELECT t1.ename, t2.dname FROM emp t1 INNER JOIN dept t2 ON ( t1.deptno = t2.deptno
);

```

```

output
-----
QUERY PLAN
-----

  Output: t1.ename, t2.dname
  Relations: (fdw_db.emp t1) INNER JOIN (fdw_db.dept t2)
  Remote SQL: SELECT r1.`ename`, r2.`dname` FROM (`fdw_db`.`emp` r1 INNER JOIN `fdw_db`.`dept` r2 ON (((r1.`deptno` = r2.`deptno`))))
(4 rows)

```

```

--left join
edb=# EXPLAIN VERBOSE SELECT t1.ename, t2.dname FROM emp t1 LEFT JOIN dept t2 ON ( t1.deptno = t2.deptno
);

```

```

output
-----
QUERY PLAN
-----
Foreign Scan (cost=15.00..35.00 rows=5000 width=84)
  Output: t1.ename, t2.dname
  Relations: (fdw_db.emp t1) LEFT JOIN (fdw_db.dept t2)
  Remote SQL: SELECT r1.`ename`, r2.`dname` FROM (`fdw_db`.`emp` r1 LEFT JOIN `fdw_db`.`dept` r2 ON (((r1.`deptno` = r2.`deptno`))))
(4 rows)

```

```

--right join
edb=# EXPLAIN VERBOSE SELECT t1.ename, t2.dname FROM emp t1 RIGHT JOIN dept t2 ON ( t1.deptno = t2.deptno
);

```

```

output
-----
QUERY PLAN
-----
Foreign Scan (cost=15.00..35.00 rows=5000 width=84)
  Output: t1.ename, t2.dname
  Relations: (fdw_db.dept t2) LEFT JOIN (fdw_db.emp t1)
  Remote SQL: SELECT r1.`ename`, r2.`dname` FROM (`fdw_db`.`dept` r2 LEFT JOIN `fdw_db`.`emp` r1 ON (((r1.`deptno` = r2.`deptno`))))
(4 rows)

```

```
--full join
edb=# EXPLAIN VERBOSE SELECT t1.ename, t2.dname FROM emp t1 FULL JOIN dept t2 ON ( t1.deptno = t2.deptno
);
```

```
output
-----
QUERY PLAN
-----
Foreign Scan (cost=15.00..35.00 rows=5000 width=84)
Output: t1.ename, t2.dname
Relations: (fdw_db.emp t1) FULL JOIN (fdw_db.dept t2)
Remote SQL: SELECT r1.`ename`, r2.`dname` FROM (`fdw_db`.`emp` r1 FULL JOIN `fdw_db`.`dept` r2 ON (((r1.`deptno` = r2.`deptno`))))
(4 rows)
```

```
--cross join
edb=# EXPLAIN VERBOSE SELECT t1.ename, t2.dname FROM emp t1 CROSS JOIN dept
t2;
```

```
output
-----
QUERY PLAN
-----
Foreign Scan (cost=15.00..35.00 rows=1000000 width=84)
Output: t1.ename, t2.dname
Relations: (fdw_db.emp t1) INNER JOIN (fdw_db.dept t2)
Remote SQL: SELECT r1.`ename`, r2.`dname` FROM (`fdw_db`.`emp` r1 INNER JOIN `fdw_db`.`dept` r2 ON (TRUE))
(4 rows)
```

Enable/disable GUC for join pushdown queries at the table level:

```
-- enable join pushdown at the table
level
ALTER FOREIGN TABLE emp OPTIONS (SET enable_join_pushdown
'true');
EXPLAIN (VERBOSE, COSTS OFF)
SELECT e.empno, e.ename,
d.dname
FROM emp e JOIN dept d ON (e.deptno =
d.deptno)
ORDER BY
e.empno;
```

```
output
-----

-> Foreign Scan on public.dept d
Output: d.dname, d.deptno
Remote SQL: SELECT `deptno`, `dname` FROM `fdw_db`.`dept`
```

Enable/disable GUC for join pushdown queries at the session level:

```

SET hdfs_fdw.enable_join_pushdown to
true;
EXPLAIN (VERBOSE, COSTS OFF)
SELECT e.empno, e.ename,
d.dname
  FROM emp e JOIN dept d ON (e.deptno =
d.deptno)
 ORDER BY
e.empno;

```

	output
	<pre> QUERY PLAN ----- Sort Output: e.empno, e.ename, d.dname Sort Key: e.empno -> Nested Loop Output: e.empno, e.ename, d.dname Join Filter: (e.deptno = d.deptno) -> Foreign Scan on public.emp e Output: e.empno, e.ename, e.job, e.mgr, e.hiredate, e.sal, e.comm, e.deptno Remote SQL: SELECT `empno`, `ename`, `deptno` FROM `fdw_db`.`emp` -> Materialize Output: d.dname, d.deptno -> Foreign Scan on public.dept d Output: d.dname, d.deptno Remote SQL: SELECT `deptno`, `dname` FROM `fdw_db`.`dept` (14 rows) </pre>

Note

You can also enable/disable join pushdown at the server level using a GUC. For more information, see [CREATE SERVER](#).

13 Example: Aggregate pushdown

This example shows aggregate pushdown between the foreign tables of the same remote HIVE/SPARK server to that remote HIVE/SPARK server.

Tables on HIVE/SPARK server:

```
0: jdbc:hive2://localhost:10000> describe
emp;
+-----+-----+-----+
| col_name | data_type | comment |
+-----+-----+-----+
| empno    | int       | NULL    |
| ename    | string    | NULL    |
| job      | string    | NULL    |
| mgr      | int       | NULL    |
| hiredate | date      | NULL    |
| sal      | int       | NULL    |
| comm     | int       | NULL    |
| deptno   | int       | NULL    |
+-----+-----+-----+
8 rows selected (0.747
seconds)
0: jdbc:hive2://localhost:10000> describe
dept;
+-----+-----+-----+
| col_name | data_type | comment |
+-----+-----+-----+
| deptno   | int       | NULL    |
| dname    | string    | NULL    |
| loc      | string    | NULL    |
+-----+-----+-----+
3 rows selected (0.067
seconds)
```

Tables on Postgres server:

```

-- load extension first time after install
CREATE EXTENSION hdfs_fdw;

-- create server
object
CREATE SERVER hdfs_server FOREIGN DATA WRAPPER hdfs_fdw OPTIONS(host 'localhost', port '10000', client_type 'spark', auth_type
'LDAP');

-- create user
mapping
CREATE USER MAPPING FOR public SERVER hdfs_server OPTIONS (username 'user1', password
'pwd123');

-- create foreign
table
CREATE FOREIGN TABLE dept
(
  deptno
  INTEGER,
  dname          VARCHAR(14),
  loc
  VARCHAR(13)
)
SERVER hdfs_server OPTIONS (dbname 'fdw_db', table_name
'dept');

CREATE FOREIGN TABLE emp
(
  empno          INTEGER,
  ename          VARCHAR(10),
  job
  VARCHAR(9),
  mgr
  INTEGER,
  hiredate
  DATE,
  sal
  INTEGER,
  comm           INTEGER,
  deptno
  INTEGER
)
SERVER hdfs_server OPTIONS (dbname 'fdw_db', table_name
'emp');

```

Enable/disable GUC for AGGREGATE pushdown queries at the session level:

```

SET hdfs_fdw.enable_aggregate_pushdown to
true;
-- aggregate functions
EXPLAIN (VERBOSE, COSTS OFF)
SELECT deptno, COUNT(*),SUM(sal),MAX(sal),MIN(sal),AVG(sal) FROM
emp
GROUP BY
deptno
HAVING deptno IN
(10,20)
ORDER BY deptno;

```

output
<pre> QUERY PLAN ----- -- Sort Output: deptno, (count(*)), (sum(sal)), (max(sal)), (min(sal)), (avg(sal)) Sort Key: emp.deptno -> Foreign Scan Output: deptno, (count(*)), (sum(sal)), (max(sal)), (min(sal)), (avg(sal)) Relations: Aggregate on (k_test.emp) Remote SQL: SELECT `deptno`, count(*), sum(`sal`), max(`sal`), min(`sal`), avg(`sal`) FROM `k_test`.`emp` WHERE (`deptno` IN (10,20)) GROUP BY `deptno` (7 rows) </pre>

Note

You can also enable/disable aggregate pushdown at the server/table level using a GUC. For more information, see [CREATE SERVER](#) and [CREATE FOREIGN TABLE](#).

14 Example: ORDER BY pushdown

This example shows ORDER BY pushdown between the foreign tables of the same remote HIVE/SPARK server as the remote HIVE/SPARK server.

Tables on HIVE/SPARK server:

```
0: jdbc:hive2://localhost:10000> describe
emp;
+-----+-----+-----+
| col_name | data_type | comment |
+-----+-----+-----+
| empno    | int       | NULL    |

```

Tables on Postgres server:

```
-- load extension first time after install
CREATE EXTENSION hdfs_fdw;

-- create server
object
CREATE SERVER hdfs_server FOREIGN DATA WRAPPER hdfs_fdw OPTIONS(host 'localhost', port '10000', client_type 'spark', auth_type
'LDAP');
```

```
-- create user
mapping
CREATE USER MAPPING FOR public SERVER hdfs_server OPTIONS (username 'user1', password
'pwd123');
```

```
-- create foreign
table
CREATE FOREIGN TABLE emp
(
  empno          INTEGER,
  ename          VARCHAR(10),
  job            VARCHAR(9),
  mgr            INTEGER,
  hiredate       DATE,
  sal            INTEGER,
  comm           INTEGER,
  deptno         INTEGER
)
SERVER hdfs_server OPTIONS (dbname 'fdw_db', table_name
'emp');
```

Enable/disable GUC for ORDER BY pushdown queries at the session level:

```
edb=# SET hdfs_fdw.enable_order_by_pushdown TO ON;
SET
edb=# EXPLAIN (COSTS OFF) SELECT * FROM emp order by
deptno;
```

output

```
QUERY PLAN
-----
Foreign Scan on emp
(1 row)
```

```
edb=# SET hdfs_fdw.enable_order_by_pushdown TO OFF;
SET
edb=# EXPLAIN (COSTS OFF) SELECT * FROM emp order by
deptno;
```

output

```
QUERY PLAN
-----
Sort
Sort Key: deptno
-> Foreign Scan on emp
(3 rows)
```

Note

You can also enable/disable ORDER BY pushdown at the server/table level using a GUC. For more information, see [create server](#) and [create foreign table](#).

15 Example: LIMIT OFFSET pushdown

This example shows LIMIT OFFSET pushdown between the foreign tables of the same remote HIVE/SPARK server as the remote HIVE/SPARK server:

Tables on HIVE/SPARK server:

```
0: jdbc:hive2://localhost:10000> describe
emp;
+-----+-----+-----+
| col_name | data_type | comment |
+-----+-----+-----+
| empno    | int       | NULL    |
| ename    | string    | NULL    |
| job      | string    | NULL    |
| mgr      | int       | NULL    |
| hiredate | date      | NULL    |
| sal      | int       | NULL    |
| comm     | int       | NULL    |
| deptno   | int       | NULL    |
+-----+-----+-----+
8 rows selected (0.747
seconds)
0: jdbc:hive2://localhost:10000> describe
dept;
+-----+-----+-----+
| col_name | data_type | comment |
+-----+-----+-----+
| deptno   | int       | NULL    |
| dname    | string    | NULL    |
| loc      | string    | NULL    |
+-----+-----+-----+
3 rows selected (0.067
seconds)
```

Tables on Postgres server:

```
-- load extension first time after install
CREATE EXTENSION hdfs_fdw;

-- create server
object
CREATE SERVER hdfs_server FOREIGN DATA WRAPPER hdfs_fdw OPTIONS(host 'localhost', port '10000', client_type 'spark', auth_type
'LDAP');
```

```
-- create user
mapping
CREATE USER MAPPING FOR public SERVER hdfs_server OPTIONS (username 'user1', password
'pwd123');
```

```
-- create foreign
table
CREATE FOREIGN TABLE emp
(
    empno          INTEGER,
    ename          VARCHAR(10),
    job            VARCHAR(9),
    mgr            INTEGER,
    hiredate       DATE,
    sal            INTEGER,
    comm           INTEGER,
    deptno         INTEGER,
)
SERVER hdfs_server OPTIONS (dbname 'fdw_db', table_name
'emp');
```

Query plan with LIMIT OFFSET pushdown:

```
-- LIMIT
OFFSET
EXPLAIN (VERBOSE, COSTS OFF)
SELECT empno FROM emp e ORDER BY empno LIMIT 5 OFFSET
2;
```

```
output
-----
QUERY PLAN
-----
Foreign Scan on public.emp e
  Output: empno
  Remote SQL: SELECT `empno` FROM `fdw_db`.`emp` ORDER BY `empno` ASC NULLS LAST LIMIT 2, 5
(3 rows)
```

Query execution:

```
SELECT empno FROM emp e ORDER BY empno LIMIT 5 OFFSET
2;
```

```
output
-----
empno
-----
7521
7566
7654
7698
7782
(5 rows)
```

Query plan with GUC for LIMIT OFFSET pushdown queries disabled at the session level (by default, LIMIT OFFSET pushdown is enabled):

```
SET hdfs_fdw.enable_limit_pushdown TO OFF;
EXPLAIN (VERBOSE, COSTS OFF)
SELECT * FROM emp ORDER BY empno LIMIT 5 OFFSET
2;
```

```
output
-----
QUERY PLAN
-----
Limit
  Output: empno, ename, job, mgr, hiredate, sal, comm, deptno
  -> Foreign Scan on public.emp
    Output: empno, ename, job, mgr, hiredate, sal, comm, deptno
    Remote SQL: SELECT * FROM `fdw_db`.`emp` ORDER BY `empno` ASC NULLS LAST
(5 rows)
```

Query execution:

```
SELECT * FROM emp ORDER BY empno LIMIT 5 OFFSET
2;
```

```
output
-----
empno | ename | job | mgr | hiredate | sal | comm | deptno
-----+-----+-----+-----+-----+-----+-----+-----
7521 | WARD | SALESMAN | 7698 | 02-22-1981 | 1250 | 500 | 30
7566 | JONES | MANAGER | 7839 | 04-02-1981 | 2975 | | 20
7654 | MARTIN | SALESMAN | 7698 | 09-28-1981 | 1250 | 1400 | 30
7698 | BLAKE | MANAGER | 7839 | 05-01-1981 | 2850 | | 30
7782 | CLARK | MANAGER | 7839 | 06-09-1981 | 2450 | | 10
(5 rows)
```

Query plan with GUC for LIMIT OFFSET pushdown queries enabled at the session level:

```
SET hdfs_fdw.enable_limit_pushdown TO ON;
-- LIMIT/OFFSET scenarios eligible for
pushdown
EXPLAIN (VERBOSE, COSTS OFF)
SELECT * FROM emp ORDER BY empno LIMIT
5;
```

```
output
-----
QUERY PLAN
-----
Foreign Scan on public.emp
  Output: empno, ename, job, mgr, hiredate, sal, comm, deptno
  Remote SQL: SELECT * FROM `fdw_db`.`emp` ORDER BY `empno` ASC NULLS LAST LIMIT 5
(3 rows)
```

Query execution:

```
SELECT * FROM emp ORDER BY empno LIMIT
5;
```

```
output
```

empno	ename	job	mgr	hiredate	sal	comm	deptno
7369	SMITH	CLERK	7902	12-17-1980	800		20
7499	ALLEN	SALESMAN	7698	02-20-1981	1600	300	30
7521	WARD	SALESMAN	7698	02-22-1981	1250	500	30
7566	JONES	MANAGER	7839	04-02-1981	2975		20
7654	MARTIN	SALESMAN	7698	09-28-1981	1250	1400	30

(5 rows)

16 Identifying the version

The Hadoop Foreign Data Wrapper includes a function that you can use to identify the currently installed version of the `.so` file for the data wrapper. To use the function, connect to the Postgres server, and enter:

```
SELECT  
hdfs_fdw_version();
```

The function returns the version number:

```
hdfs_fdw_version  
-----  
<xxxxx>
```
